

ABSTRACT

[0030] A splice connector includes a clam shell housing having a first portion attached to a second portion via a sliding hinge. The housing defines cable seats to receive an associated cable to be spliced to another associated cable. A terminal is received in the housing and includes a first prong aligned with the first cable seat and a second prong aligned with the second cable seat. The terminal electrically connects a wire of the first associated cable to a wire of the second associated cable.
